Virtual Knot Theory: VKT

Introduction Motivation Combinatorial basis of Classical Knot Theory Combinatorial basis of Virtual Knot Theory

÷.

Virtual Knot Theory: VKT

VKT is a generalization of CKT. (Knot means link in our context)

Virtual Knot Theory: VKT

VKT is a generalization of CKT. (Knot means link in our context)

Definition

A virtual knot diagram is a classical diagram with a new sort of crossing, denoted as shown in Fig. 10 as a 4-valent vertex with a small circle around it.

Two sources of motivation:

イロト イロト イヨト イ

프 > 프

Two sources of motivation:

- The study of knots in thickened surfaces of higher genus.
- The extension of knot theory to the purely combinatorial domain of Gauss codes and Gauss diagrams.

Surfaces

Let S_g be a surface of genus g, then the knot theory in $S_g \times [0, 1]$ is represented by diagrams drawn on S_g taken up to the usual Reidemeister moves transferred to diagrams on this surface.

< ロ > < 同 > < 三 >

Let S_g be a surface of genus g, then the knot theory in $S_g \times [0, 1]$ is represented by diagrams drawn on S_g taken up to the usual Reidemeister moves transferred to diagrams on this surface.

Remark : The VKT does not demand the use of a particular surface embedding, but it does apply to such embeddings.

Let S_g be a surface of genus g, then the knot theory in $S_g \times [0, 1]$ is represented by diagrams drawn on S_g taken up to the usual Reidemeister moves transferred to diagrams on this surface.

Remark : The VKT does not demand the use of a particular surface embedding, but it does apply to such embeddings. This constitutes one of the motivations.

Gauss Codes

A second motivation comes from the use of so-called *Gauss codes* to represent knots and links.

프 > 프

< □ > < 同 > < 三 > <

Gauss Codes

A second motivation comes from the use of so-called *Gauss codes* to represent knots and links.

The Gauss code is a sequence of labels for the crossings with each label repeated twice to indicate a walk along the diagram from a given starting point and returning to that point.

Gauss Codes

Suppose that g is such a sequence of labels. The first necessary criterion for the planarity is given by the following definition and lemma.

Suppose that g is such a sequence of labels. The first necessary criterion for the planarity is given by the following definition and lemma.

Definition

A single component Gauss code is said to be *evenly intersticed* if there is an even number of labels between the two appearences of any label.

Suppose that g is such a sequence of labels. The first necessary criterion for the planarity is given by the following definition and lemma.

Definition

A single component Gauss code is said to be *evenly intersticed* if there is an even number of labels between the two appearences of any label.

Lemma

If g is a single component **planar** Gauss code, then g is evenly intersticed.

Suppose that g is such a sequence of labels. The first necessary criterion for the planarity is given by the following definition and lemma.

Definition

A single component Gauss code is said to be *evenly intersticed* if there is an even number of labels between the two appearences of any label.

Lemma

If g is a single component **planar** Gauss code, then g is evenly intersticed.

Proof : This follows directly from the Jordan curve theorem in the plane.

Introduction Motivation

Remarks :

▲□▶▲□▶▲≡▶▲≡▶ ≡ のへで

Remarks :

• The necessary condition in the Lemma is not sufficient for planarity. The code g = 1234534125 is evenly intersticed but not planar.

æ

Remarks :

- The necessary condition in the Lemma is not sufficient for planarity. The code g = 1234534125 is evenly intersticed but not planar.
- Non-planar Gauss codes give rise to an infinite collection of virtual knots.

< ロ > < 回 > < 回 > < 回 > < 回 > <</p>

Definition

A virtual knot is an equivalence class of Gauss diagrams (or Gauss codes). Two Gauss diagrams represent the same virtual knot if there is a sequence of the three Reidemeister moves that changes one diagram into the other. Such a sequence will be called a *virtual isotopy*.

Definition

A virtual knot is an equivalence class of Gauss diagrams (or Gauss codes). Two Gauss diagrams represent the same virtual knot if there is a sequence of the three Reidemeister moves that changes one diagram into the other. Such a sequence will be called a *virtual isotopy*.

Definition

A Gauss code which represents an ordinary knot diagram is called *classical* or *realizable*, and a Gauss diagram which does not represent a real knot (i.e. one for which we have to introduce additional crossings to make the diagram work) is called *non-classical* or *non-realizable*.

Remark : Any sequence of ordinary Reidemeister moves for ordinary knot diagrams translates to a sequence of Reidemeister moves for Gauss diagrams.

Virtual Knots

H. Abchir

Remark : Any sequence of ordinary Reidemeister moves for ordinary knot diagrams translates to a sequence of Reidemeister moves for Gauss diagrams.But one can turn a realizable knot into a non-realizable one by using the above moves: an unknotted diagram, can be changed into the non-realizable diagram U1 + U2 - O1 + O2 by a type II move.

Remark : Any sequence of ordinary Reidemeister moves for ordinary knot diagrams translates to a sequence of Reidemeister moves for Gauss diagrams.But one can turn a realizable knot into a non-realizable one by using the above moves: an unknotted diagram, can be changed into the non-realizable diagram U1 + U2 - O1 + O2 by a type II move.

Figure: non-realizable Gauss code

Theorem

Two virtually equivalent classical knots are classically equivalent. In other words, if two realizable Gauss diagrams are virtually isotopic, then they have realizations which are connected by a sequence of ordinary isotopies.

< □ > < 同 > < 三 > <

Theorem

Two virtually equivalent classical knots are classically equivalent. In other words, if two realizable Gauss diagrams are virtually isotopic, then they have realizations which are connected by a sequence of ordinary isotopies.

Remark : The signed codes are knot theoretic anlogues of the set of all graphs, and the classical knot are the analogues of planar graphs. This is the fundamental combinatorial motivation for the last definition of virtual knots.

Introduction Motivation

Theorem

If K is a virtual knot whose underlying Gauss code is planar and whose sign sequence is standard, then K is equivalent to a classical knot.
